EURUSD Strategy: CRT Model and Asian Range Model

Isaiah | EURUSD only | ICT methodology | October 12, 2026

Key Terms

- **CRT:** a candle range theory setup on the daily or 4H. Only the third candle is traded.
- **Model #1 (entry trigger), bearish:** the last up-close candle that took out a high. When price closes below it, enter at that candle's low. Bullish mirrors this: the last down-close candle that took out a low; when price closes above it, enter at that candle's high.
- **PLP (pre-open liquidity pool):** a high or low that, if taken out, looks like a market structure shift but is actually a fake one (a liquidity grab). That is what makes it a good entry.
- **SMT:** divergence between EURUSD and GU (GBPUSD) or DXY. Only EURUSD is traded.
- **Premium / discount:** above or below 50% of the current daily range.

Model 1: Top-Down CRT Model

1. Weekly bias

- Weekly close below the previous week's candle: bearish
- Weekly wick above the previous week's high: bearish
- Weekly close above the previous week's high: bullish

2. Daily target

- Only three types of level: FVG, order block, swing high or low
- If several sit in the bias direction, the swing high or low is the target
- Best targets sit on the opposite side of the 50% of the daily range. If price is in premium, target a low in discount (and vice versa).

3. Wait for a CRT

- On the daily or the 4H, in the bias direction only

4. Entry on the third candle

1. The third CRT candle opens.
2. Mark a PLP one tier down: 1H for a daily CRT, 15M for a 4H CRT.
3. After the PLP is taken, find the Model #1 candle.
4. Enter at the Model #1 level.

5. Stop loss

- Above the entry candle for shorts, below it for longs

6. Exits

- **Exit 1:** 50% of the CRT. Close 60% of the position.
- **Exit 2:** the opposing range of the CRT. Close the remaining 40%.
- Do not move the stop to breakeven, because price tends to retrace through the entry.

7. Repeat

- Keep taking third-candle CRTs in the bias direction until the daily target is reached.

Model 2: Asian Range Model

1. Daily bias (for the next day)

- Wick above the previous day's high: lower prices
- Wick below the previous day's low: higher prices
- Close above the previous day's high: higher prices
- Close below the previous day's low: lower prices

2. 1H alignment check

- Bullish: 1H highs are being broken and lows rejected
- Bearish: 1H lows are being broken through and highs rejected
- If the 1H profile is unclear or does not align, skip the trade.

3. Mark the Asian range

- Window: 20:00 to 00:00 New York time
- Mark the high and low inside that window

4. Scenario A: false break (sweep and reject)

- Bullish example: the range low is swept and rejected.
- **SMT is always required** (GU or DXY vs EURUSD). It can be at the daily PLP, on the day before where the bias was set, or at the Asian range itself.
- Wait for Model #1, then enter.
- Stop: below the entry candle (above for shorts).
- **Target 1:** 50% of the Asian range. Close 60%.
- **Target 2:** the opposing end of the Asian range. Close the remaining 40%.

5. Scenario B: true break

- A true break is a 5-minute close beyond the range high (bullish) or low (bearish).
- SMT is not required, but it raises the probability.
- Mark the 50% of the Asian range and wait for price to return to it, where a 1H or 4H key level (a high or low) sits.
- Enter on Model #1.
- Same stop as above.
- **One target only:** the high formed after the true break (the low, when bearish).

6. Highest-probability condition

- The daily PLP lines up with the Asian range high or low.

7. Management

- No breakeven in either scenario.

Pre-Trade Checklist

[ ] Weekly bias set (CRT model) or next-day daily bias set (Asian range model)
[ ] Target marked and on the correct side of the daily 50%
[ ] 1H profile agrees with bias (Asian range model); otherwise skip
[ ] CRT identified, or Asian range marked (20:00 to 00:00 NY)

- [ ] PLP marked on the correct lower timeframe
- [ ] False break: SMT confirmed on GU or DXY
- [ ] True break: 5M close confirmed, 50% marked, key level at the 50%
- [ ] Model #1 candle identified and entry set
- [ ] Stop placed above (shorts) or below (longs) the entry candle
- [ ] Exits set: 60% at the first level, 40% at the second (or the single high on a true break)

Not Yet Defined

- What invalidates the bias
- When to stop taking new CRTs before the target is reached
